DOI:10.1103/PhysRevE.93.022111 ISSN:2470-0045Abstract:We revisit the universal behavior of crystalline membranes at and below the crumpling transition, which pertains to the mechanical properties of important soft and hard matter materials, such as the cytoskeleton of red blood cells or graphene.Â Specifically,Â we perform large-scale Monte Carlo simulations of a triangulated two-dimensional phantom network which is freely fluctuating in three-dimensional space.Â We obtain a continuous crumpling transition characterized by critical exponents which we estimate accurately through the use of finite-size techniques.Â By controlling the scaling corrections, we additionally compute with high accuracy the asymptotic value of the Poisson ratio inÂ theÂ flatÂ phase,Â thusÂ characterizingÂ theÂ auxeticÂ propertiesÂ ofÂ thisÂ class of systems.Â Â WeÂ obtain agreementÂ withÂ theÂ valueÂ whichÂ isÂ universallyÂ expectedÂ forÂ polymerizedÂ membranesÂ withÂ fixed connectivity.
